

**Amendments to the Claims:**

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) An electro-optical apparatus, comprising:  
an electro-optical device having an image display region on which projection light from a light source is incident; ~~and~~  
a mounting case including a plate disposed to face one surface of the electro-optical device and a cover covering the electro-optical device, at least one of the plate and the cover including a surface that extends substantially parallel with the image display region of the electro-optical device, the surface being formed with a window, a portion of the cover abutting against the plate, the mounting case accommodating the electro-optical device by holding at least a portion of a peripheral region positioned at the circumference of the image display region of the electro-optical device with at least one of the plate and the ~~cover~~cover; and  
double coated adhesive tape being between the surface of the at least one of the plate and the cover and the electro-optical device,  
the surface of the at least one of the plate and the cover being bonded to the electro-optical device by the double coated adhesive tape at the periphery of the window.
2. (Canceled)
3. (Previously Presented) The electro-optical apparatus according to Claim 1, the double coated adhesive tape including a material having the heat conductivity of  $0.6 \text{ W/m} \cdot \text{K}$  or more.
4. (Previously Presented) The electro-optical apparatus according to Claim 1, the double coated adhesive tape including acryl rubber.
5. (Previously Presented) The electro-optical apparatus according to Claim 1,

the double coated adhesive tape being provided to correspond to the whole peripheral region,

at least one of the plate and the cover being bonded to the electro-optical device over the whole peripheral region.

6. (Original) The electro-optical apparatus according to Claim 1, the thickness of the double coated adhesive tape being in the range of 50 to 200  $\mu\text{m}$ .

7. (Original) The electro-optical apparatus according to Claim 1, at least one of an outmost surface of the plate and an outmost surface of the cover being black.

8. (Previously Presented) The electro-optical apparatus according to Claim 7, a plating process being performed on the surface of the at least one of the plate and the cover.

9. (Original) The electro-optical apparatus according to Claim 8, the plating process being performed after performing a blast process on at least one of the surface of the plate and the surface of the cover.

10. (Original) A projection display apparatus, comprising:  
the electro-optical apparatus according to Claim 1;  
the light source;  
an optical system to guide the projection light into the electro-optical device;  
and  
a projection optical system to project the light emitted from the electro-optical device.
